WEEK – 07

1) Create detailed user stories for the above identified problem

➤ **Summary: School Management System**

➤ **User Stories:**

1) As a student

I want to log in to the school management system using my unique credentials so that I can easily access my personal information, view my course schedule, track my grades, submit assignments and communicate with teachers in a secure and user friendly manner.

2) As a teacher

I want to log in to the school management system using my unique credentials so that I can easily communicate with students, I can easily give home works and assignments to students and evaluate the activities.

3) As a admin

I want to log in to the school management system using my unique credentials so that I can easily manage student and teachers records,I can easily manage course.

➤ **Scope:**

1. Build a login page
2. Student validation
3. Student should be able to change the password
4. It should work in all the browsers
5. It should also works in mobile

➤ **Pre condition:**

Student should have registered in school management software.

➤ **Acceptance Criteria:**

- **Scenario 1: User can successfully login**

  Given I am on login page

  AND I give valid username and password

  And I click on Sign in

  Then I will successfully login

- **Scenario 2: Student cannot login successfully**

  Given I am on login page

  And I give in-valid username and password

  And I click on Sign in

  Then I will get a error message as

  “Login failed, Invalid username and password”

2) Organize and playplanning poker todecide on user points.

What is Planning Poker?

Planning Poker (also called Scrum Poker) is a technique used by agile teams to estimate the effort required to complete tasks.It is a group-based and interactive method where team members use numbered cards to estimate story points.Common number sequence: **0, 1, 2, 3, 5, 8, 13, 20, 40, 100** (Fibonacci series).

How Does Planning Poker Work?

Step 1: Distribute Cards

Each team member receives a deck of numbered cards used for estimation.

Step 2: Read the User Story

The product owner reads the user story aloud and explains it.

Team members can ask questions for clarification.

Step 3: Discuss the Story

The team discusses:

- Work required
- Skills needed
- Number of people involved
- Possible risks or difficulties

Step 4: Select and Reveal Cards

Each member privately selects a card showing their estimate. All cards are revealed at the same time. Higher numbers mean more effort or difficulty.

Step 5: Reach Consensus

- If everyone selects the same number → estimation is finalized.
- If numbers differ → discuss again and re-vote.
- Process repeats until the team agrees on one estimate.

WEEK- 8

1. Create Sitemap and Wireframe for above create user stories

1. Sitemap

- A sitemap is a blueprint of your website that **help search engines find, crawl and index all your website's content**. Sitemaps also tell search engines which pages on your site are most important.
- A sitemap is a list of pages that are contained in a website that is accessible to website crawlers or users.
- A site map is the structure or list of pages on a website.

Steps to create sitemap

Step 1:- Go to google, in searchbar search like draw.io

Step 2:- Click on draw.io software tool link

Step 3:- Choose Blank diagram

Step 4:- Drag and drop Rectangle shapes, and named these rectangles as home page, student, teacher, parent, admin etc

Step 5:- Place the arrow marks properly

Step 6:- Put the colors that you want on Rectangle shapes

Wireframe

- A **wireframe** is a simple diagram that shows the basic structure of a website or mobile application.
- It represents the **layout, content placement, navigation, and main functions** of a page.
- It is a **two-dimensional blueprint** that focuses on space allocation and user interaction.
- Wireframes usually **do not include colors, images, fonts, or styling**.
- They are created **early in the development process** before visual design and coding.
- Wireframes help designers understand **user needs and user journey**.
- They make it easier to discuss ideas and make changes before final development.
- It shows what interface elements (buttons, menus, forms, images) will appear on key pages.

Steps to create wireframe

Step 1:- Go to google, in search bar search like draw.io

Step 2:- Click on draw.io software tool link

Step 3:- Choose Blank diagram

Step 4:- Click on more shapes

Step 5:- Select Mock up option and click on apply

Step 6:- From Mock up container option drag and drop the Browser windows

Step 7:- From general option drag and drop the text option on the top of the browser windows, in the text option type like home page

Step 8:- From Mock up icons option drag and drop the icon placeholder on top right of website, select text option and named it as logo

Step 9:- From Mock up text option drag and drop horizontal button bar on top left of website

Step 10:- From Mock up graphics option drag and drop icon placeholder again on front of home page and select text option and named it as image slider showing special promotions

Step 11:- From general options drag and drop 3 circles, scale them small and design them as buttons

Step 12:- From Mock up text option, drag & drop paragraph of text

Step 13:- From Mock up misc option drag & drop shopping basket shape
